

Expected Outcome for Documentation Tasks

Each documentation task follows a **standard discovery → creation → validation → QA enablement** workflow.

The goal is **usable, accurate, standardized documentation** that supports both users *and* QA.

1. Discovery & Existing Documentation Review

- Determine whether documentation already exists for the feature/process. (You can talk to the lead developer to see if they've already created something)
- Identify **where it lives**, if applicable (BookStack, SharePoint, repo, prior tickets, etc.).
- Review related ClickUp tasks, PRs, or release notes for context.

2. Developer Alignment

- Meet with the **lead developer** for the project to confirm:
 - Whether the feature is complete
 - What documentation (if any) already exists
 - Any technical or functional nuances that must be captured
- Confirm the **source of truth** for behavior and edge cases.

3. Documentation Path Decision

Based on discovery:

- **If documentation exists:**
 - Validate it is current and complete
 - Make sure it resides in BookStack
 - Identify gaps, inaccuracies, or outdated content
- **If documentation does not exist:**

- Interview the developer to gather sufficient functional and user-facing detail
- Clarify workflows, inputs, outputs, constraints, and expected behavior

4. Draft & Standardize Documentation

- Create or update documentation using the **approved documentation template** for consistency.
- Ensure:
 - Clear language (non-ambiguous, user-readable)
 - Logical structure
 - Correct terminology
 - No spelling, grammar, or formatting errors
- Store documentation in BookStack unless otherwise specified.

5. Developer Review & QA

- Submit the documentation to the **developer for review**.
- Address any feedback, corrections, or clarifications provided.
- Confirm developer sign-off that the documentation accurately reflects the system.

6. QA Enablement

- Once approved, share documentation with the **QA team**.
- Ensure the documentation is detailed enough that QA can:
 - Create **manual TestPad tests**
 - Derive **E2E or regression test scenarios**
- Incorporate QA feedback if documentation clarity blocks test creation.

7. Finalization

- Confirm:
 - Documentation is approved
 - Stored in the correct location
 - Linked back to the ClickUp task
- Mark the task ready for completion.

End Goal (What “Done” Means)

- Documentation exists (or is improved)
- It is accurate, readable, standardized, and approved
- Developers agree it reflects actual behavior
- QA can successfully write tests from it without additional clarification
- Add the documentation link from BookStack into ClickUp to easily track that it has been done or already exists.
